Healthy Babies are Worth the Wait: High Risk Pregnancies Exempted

Luis A. Bracero, MD
Professor of Obstetrics and Gynecology
Director of Maternal Fetal Medicine
Women and Children's Hospital
West Virginia University Robert C. Byrd Health Sciences Center
Charleston Campus, WV

March of Dimes
Birth Defects Foundation

Mission:
- To improve infant health by preventing infant mortality, birth defects and PTB/LBW

The Continuum of Reproductive Health
- Improving health of infants requires focusing on the entire spectrum of reproductive health from prior to conception through the first year of an infant’s life and throughout the woman’s childbearing years
- Preconception health is the cornerstone of healthy infants, children, families and communities

Objectives
- Briefly review the changing epidemiology of preterm birth
- Discuss the paradigm shift that most spontaneous preterm birth meets the criteria of other common complex disorders such as heart disease
- Summarize the impact of late preterm birth (34-36 weeks) on increasing rates of preterm birth

Preterm Birth
- #1 obstetric challenge in the US
- Major cause of loss
  - majority of all perinatal mortality
  - leading cause of neonatal mortality (since 1999)
  - leading cause of black infant mortality and second leading cause of all infant mortality in US?
- Leading problem in pediatrics
  - leading cause of neonatal morbidity
  - half of all neurodevelopmental conditions
- Associated with higher rates of chronic illness in adults
- Serious, common, and costly

Three Leading Causes of Infant Mortality
United States, 1990 and 2004*

Preterm Birth Rates by State
United States, 2003

U.S. Total = 12.3%

Percent of Live Births

Preterm Birth as a Common Complex Disorder
(like other chronic conditions: heart disease, cancer)

• Complex
  • Genetic contribution
    – Familial aggregation
    – Recurrence of preterm birth
    – Racial disparity
  • Environmental influences
  • Gene-environment interactions
  • Many of the risk factors are the same

PTB Risk Factors

• The strongest risk factors for PTB suggest a maternal or fetal genetic predisposition
• Women born preterm are more likely to deliver preterm
  – ~20% of women who deliver preterm have recurrence with the same partner
  – changing partners reduces the risk by one third
• The heritability of PTB is estimated to be 17%-36%
• 18 studies reviewed on genetic polymorphisms showed that polymorphisms in TNF alpha showed the most consistent increase in PTB
• Environmental factors such as infection, stress, and obesity suggest that environmental and genetic RF might operate and interact through related pathways.

Risk Factors for Preterm Labor/Delivery

- The best predictors of having a preterm birth are:
  - current multifetal pregnancy
  - a history of preterm labor/delivery or prior low birthweight
  - mid trimester bleeding (repeat)
  - some uterine, cervical and placental abnormalities
- Other risk factors:
  - unintended pregnancy
  - maternal age (<17 and >35 yrs)
  - black race
  - low SES
  - unmarried
  - previous fetal or neonatal death
  - >3 spontaneous terminations
  - uterine abnormalities
  - incompetent cervix
  - cervical procedures
  - genetic predispositions
  - low pre-pregnant weight
  - obesity
  - infections
  - anemia
  - major stress
  - lack of social supports
  - tobacco use
  - illicit drug use
  - alcohol abuse
  - folic acid deficiency

Can Preterm Labor be Prevented?

- Primary prevention is the goal
  - especially risk reduction in the preconceptional period and early in pregnancy
- Preterm prevention programs have focused on risk assessment or prediction of preterm labor
  - risk assessment identifies only half of preterm births
  - during pregnancy most biomarkers, even in combination with risk factors, do not have good positive predictive values
- Causation is the great unknown

Major Pathways to Preterm Labor

- Inflammation/infection (ascending), 40%
  - cytokines
- Stress (maternal/fetal), 25%
  - CRH
- Bleeding (decidual hemorrhage, abruption), 25%
  - thrombin
- Stretching (uterine distention), 10%

Definitions

- Preterm birth: < 37 completed weeks gestation
- Late preterm (or Near-Term): 34-36 completed weeks
- Very preterm: <32 completed weeks

While this suggests distinct pathways, many of the risk factors for all 3 are similar
Why are Late Preterm Rates Rising?

- Changing culture of childbearing
  - more high risk pregnancies (AMA, chronic/developing problems, multiples, infertility management, obesity, GDM)
  - public preference/autonomy (induction and cesarean on maternal request)
  - changes in clinical management (more interventions)
    - litigious environment, fear of suit, defensive medicine
      - 2006 ACOG liability survey 89.2% (79.1% in 2003) named in a claim, avg 2.6/career
  - reimbursement system changes
  - window to administer antenatal steroids 24-34 weeks
  - increase in survival to almost 100% at 34 weeks
  - increasing rates of elective inductions and section before 39 weeks despite ACOG guidelines

Late Preterm Facts

- Late preterm delivery is increasing
  - up at least 16% from 1993
  - straining the Public Health system
  - 52% of late preterm infants are delivered by cesarean, a much higher rate than term infants
- Late-Preterm infants are:
  - a majority of NICU admissions
  - the greatest percentage of NICU patients to receive respiratory support
  - the majority of NICU economic costs
Late Prematurity Facts

- often the sickest babies in a NICU
- more likely than a full term baby to be rehospitalized in the first year of life
- twice as likely to die in the first year of life as a full term baby
- at risk for long term health issues

Singletons by Birth Category

1992  1997  2002
• Spontaneous:  68.1%  63.4%  56.8%
• PROM: 3.0%  2.7%  2.2%
• Intervention: 28.9%  33.9%  41.0%

U.S. Late Preterm live births are on the rise: % Change 1992-2002

Percent Change, Gestational Age-Specific Distribution
Singleton Live Births, Spontaneous

* Adjusted for maternal race/ethnicity and maternal age. All rates significantly different (p < 0.05) between 1992 and 2002, except at 32-34 weeks.
Late Preterm Births (34-36 weeks)
WV and US, 1993-2003

WV LPTB increase 31.6%
US LPTB increase 15.8%

July 2005- Invitational NICHD Workshop on Near Term/Late Preterm births (34-36 weeks)

Costly: Distribution of Hospital Stays and Hospital Charges, United States, 2003

Factors that Contribute to Increasing Rates of Preterm Birth

- Increasing rates of births to women 35+ years of age
- Increasing rates of multiple births
- Indicated deliveries
  - Induction
  - Management of maternal and fetal conditions
  - Patient preference/consumerism (CDMR)
- Substance abuse
  - Tobacco
  - Alcohol
  - Illicit drugs
- Bacterial and viral infections
- Increased stress (catastrophic events, DV, racism)

Institute of Medicine Report, July 2006

The IOM estimates the total national cost of premature births to be at a minimum $26.2 billion.
This estimate includes many costs, such as inpatient hospital costs, lost wages and productivity and early intervention programs.

Costly: Distribution of Hospital Stays

Smoking Cessation and Preterm Birth
(Cochrane Review)

- 64 trials (51 RCTs of 20,931 women) and 6 cluster-randomised trials (over 7500 women) provided data on
smoking cessation and/or perinatal outcomes
- Smoking cessation interventions reduced low birthweight (RR 0.81, 95% CI 0.70 to 0.94) and preterm birth (RR 0.84,
95% CI 0.72 to 0.98)
- One intervention strategy, rewards plus social support, resulted in a significantly greater smoking reduction than
other strategies (RR 0.77, 95% CI 0.72 to 0.82).
- Smoking cessation programs in pregnancy reduce the proportion of women who continue to smoke, and reduce
low birthweight and preterm birth.

Substance Abuse
WV and US, 1999-2003

Smoking Cessation and Preterm Birth
Prevention of Preterm Labor, Preterm Delivery and Prematurity

- Primary prevention
  - identifying and managing risks
  - risk reduction approach and strategies to reproductive health
  - prevent PTL
- Secondary prevention
  - prevent preterm delivery
- Tertiary prevention
  - prevent/minimize complications of prematurity

Preventive measures can include targeted smoking intervention and smoking cessation programs in pregnancy.
Pre/Interconception Internatal Care

- Readiness for pregnancy (FP, prevent unintended pg, interval between pregnancies)
- Optimal management of medical conditions (diabetes, HBP, asthma, heart disease, addictions, depression)
- Infections and STIs
- Immunizations
- Family history, genetic counseling, carrier testing
- Substance abuse (smoking, alcohol, other drugs)
- Domestic violence (DV/IPV)
- Stress reduction
- Optimal weight and activity
- Good nutrition-- folic acid for men and women
- Avoid teratogens (work site, environment)
- Review all meds and home remedies with hcp

Prevent the Preventable

- Ø Unintended pregnancies
- Ø Folic acid deficiency
- Ø Alcohol
- Ø Tobacco
- Ø Illicit drugs
- Ø Infections (UTIs, STIs, periodontal disease)
- Ø Extremes of weight
- Ø Some medications (Rx, OTC, home remedies)
- Ø Environmental toxins
- Ø Known genetic/familial risks
- Ø Unnecessary interventions resulting in preterm birth
- Promote appropriate level designation and regionalization

Take Home Messages

- Preterm birth is a common complex disorder meeting criteria for high public health priority
- Intervene throughout the continuum of reproductive health for women and men with culturally sensitive, health literacy appropriate risk reduction interventions
- All providers have a major role in the success of primary and secondary prevention
- All pregnant women may be at risk for preterm labor and birth and should be taught the signs and symptoms beginning about 20 weeks of gestation
- A multidisciplinary approach is needed
- Everyone can make a difference
