Private water wells, springs, cisterns and piping sometimes have a build-up of bacterial contamination which requires a disinfection process to correct the problem. Periodically public water supplies are required to issue a boil water notice. Attached are two guidelines, *Disinfecting The Water Supply* and *How To Disinfect Small Quantities Of Water*, which you may copy and distribute for use in these circumstances.

Please note that a positive-feed hypochlorinator or NSF approved ultraviolet disinfection unit must be installed on private springs or cisterns which require health department approval as outlined in Environmental Health Procedures memoranda DW-1 and H-12. Test results for other springs and cisterns are for the owner's personal information only.
